

CPSC1520 – JavaScript 5 Exercise: Arrays and Loops

Introduction

Arrays are essential data structures that are used not only in JavaScript but essentially every programming language. In this exercise you will be: filtering a list of items based on the platform selected, adding a video game to “my favourites” if the video game item in the “classics” section is clicked, and as removing the video game item from the “my favourites” section.

Exercise Step 1: Filter The List

1. You are given a form that listens to submit events. Create a function named “filterGames” that has one parameter. As well call this function in the “videoGameForm” event handler with the “platform” variable as the argument.
2. In the “filterGames” function use the “forEach” method on the “allGameListItems” to loop over each element. You are essentially going to show the list items which meet are the same as the platform argument you passed in previous step.
 - a. If the element includes (you can use .include on the innerText of the element) remove the “hidden-item” class (defined in the main.css file) from the list item.
 - b. Otherwise add the “hidden-item” class to the to the element.
3. If you select different values in the select you should see now other video game platforms (other than the one you have selected) to be filtered out. Once your output looks like the picture below then move to the second step. Selecting “switch” should look like below.

Video Game Favourites

Switch ▾

Filter

Classics

My Favourites

The Legend of Zelda: Breath of the Wild, (Switch)
Super Mario Odyssey, (Switch)
The House in Fata Morgana - Dreams of the Revenants Edition -, (Switch)
Tetris Effect: Connected, (Switch)
Hades, (Switch)
Divinity: Original Sin II - Definitive Edition, (Switch)

Exercise Step 2: Add to Favourites

1. You are given an event listener on the “allGames” list that listens to click events. Create a function named “addToFavouriteGames” that has one parameter named “game”. As well within the event handler call the function “addToFavouriteGames” with the game as the argument.
2. In the “addToFavouriteGames” function push the new argument value of game on to the array of “myGames”. Note: If you print out the array to the console and you should see all of the items you’ve clicked.

3. Create a new function named “renderFavouriteList” that takes no parameters. You’ll do a couple of things in this function:
 - a. Set the innerHTML of “myGamesList” to an empty string.
 - b. Loop through the array “myGames” either with the map method or the forEach method. In each iteration you want to add the html of a list item (this is given in the javascript file) to the innerHTML of “myGamesList”. Note: you’ll need to continuously add to the innerHTML so you might want to look at “+=”
4. Call your new function “renderFavouriteList” in the function “addToFavouriteGames” after you have pushed the new game to the “myGames” array.
5. If you filter the values to “Nintendo 64” and you click on the games “GoldenEye 007” and “Super Mario 64” you should see the following:

Video Game Favourites

Nintendo 64

Filter

Classics

The Legend of Zelda: Ocarina of Time, (Nintendo 64)
Perfect Dark, (Nintendo 64)
GoldenEye 007, (Nintendo 64)
The Legend of Zelda: Majora's Mask, (Nintendo 64)
Super Mario 64, (Nintendo 64)

My Favourites

GoldenEye 007, (Nintendo 64)
Super Mario 64, (Nintendo 64)

Once you see the above then you can proceed to the next step.

Exercise Step 3: Remove From Favourites

1. You are given an event listener on the “myGameList” list that listens to click events. Create a function named “removeFromFavouriteGames” that has one parameter named “game”.
2. In the “removeFromFavouriteGames” function we’re going to remove the game from the “myGames” list. You’ll do this by:
 - a. Get the index of the game selected by calling the method “indexOf” with the argument “game” on the list “myGames” assign this to a variable (you can name it index as that seems like a good name for the index)
 - b. On the list “myGames” call the method “splice” with the two arguments: the index selected above first, and 1 as the second argument.
 - c. As the last step in this function call the function “renderFavouritesList”.
3. To test this do the following:

- a. If you filter the values to “Nintendo 64” and you click on the games “GoldenEye 007” and “Super Mario 64” you should see the following (based on the previous step)

Video Game Favourites

Nintendo 64▼

Filter

Classics

The Legend of Zelda: Ocarina of Time, (Nintendo 64)
Perfect Dark, (Nintendo 64)
GoldenEye 007, (Nintendo 64)
The Legend of Zelda: Majora's Mask, (Nintendo 64)
Super Mario 64, (Nintendo 64)

My Favourites

GoldenEye 007, (Nintendo 64)
Super Mario 64, (Nintendo 64)

- b. If you click on “Golden Eye” you should see the following:

Video Game Favourites

Nintendo 64▼

Filter

Classics

The Legend of Zelda: Ocarina of Time, (Nintendo 64)
Perfect Dark, (Nintendo 64)
GoldenEye 007, (Nintendo 64)
The Legend of Zelda: Majora's Mask, (Nintendo 64)
Super Mario 64, (Nintendo 64)

My Favourites

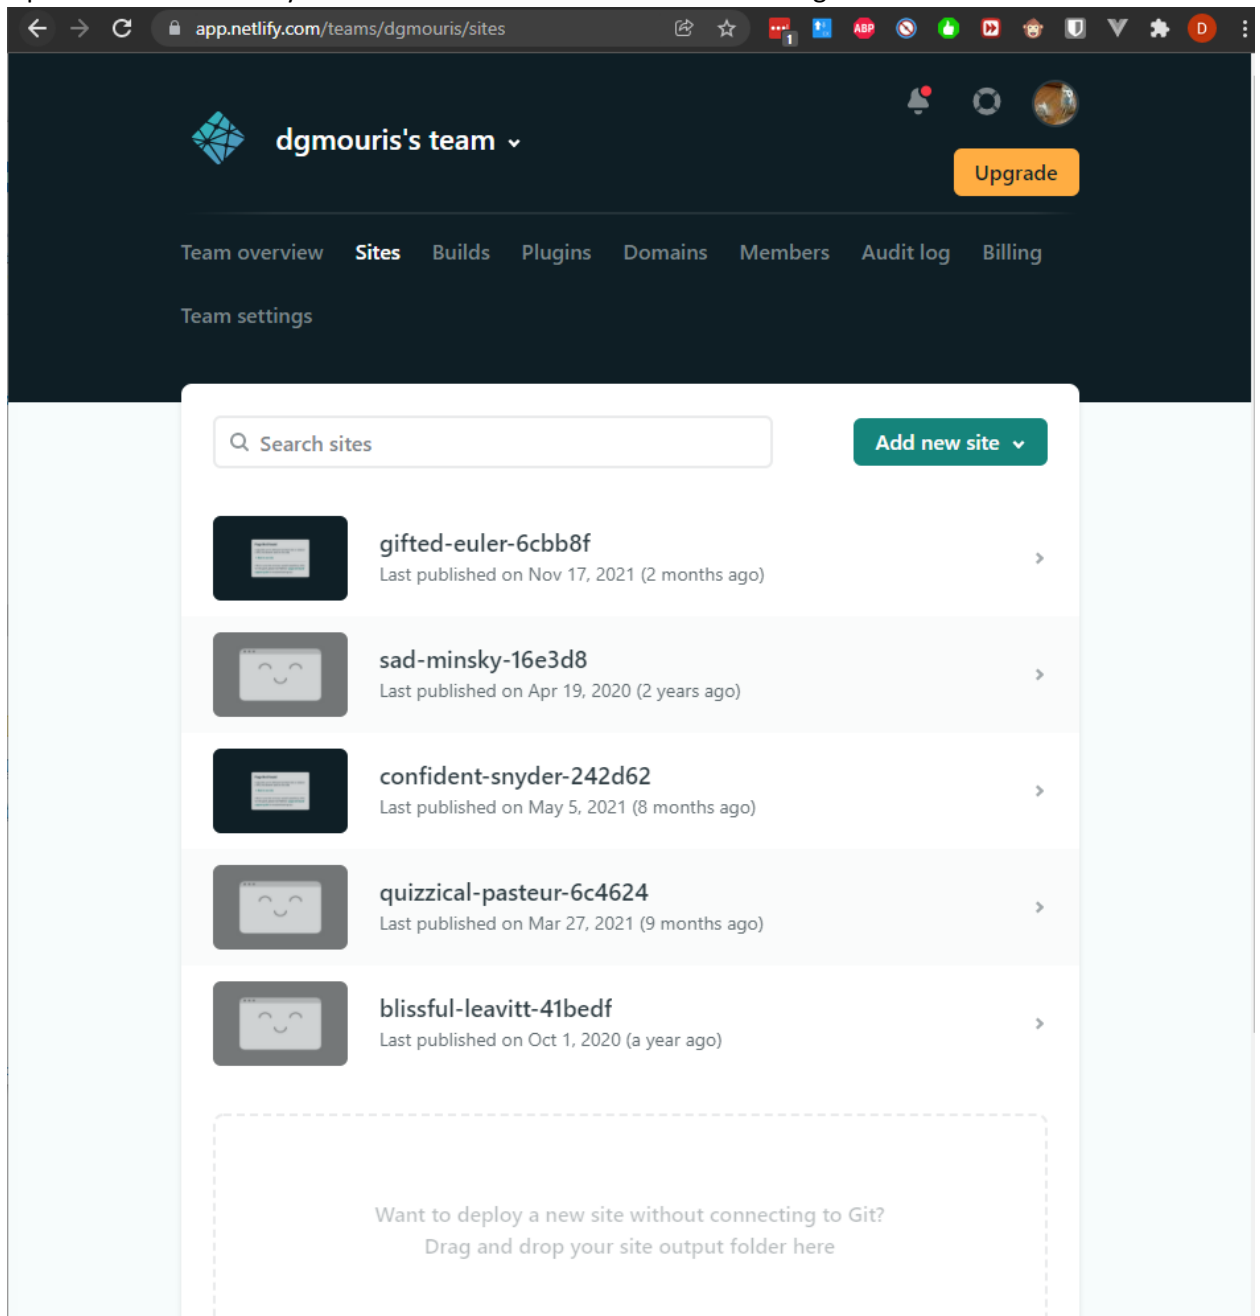

GoldenEye 007, (Nintendo 64)
Super Mario 64, (Nintendo 64)

Once you done this upload your site to netlify.

Exercise Step 4 – upload your site to Netlify

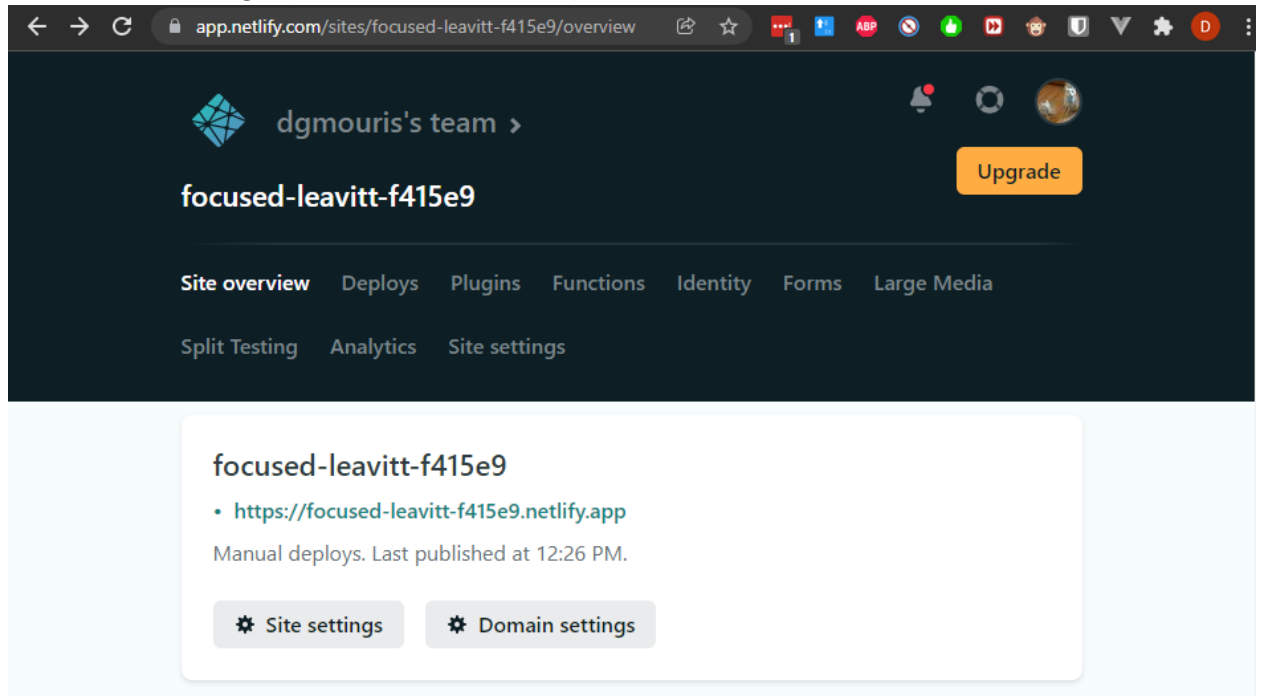

1. Sign in (or signup if you don't have an account) to <https://netlify.com/>

2. Open the “sites” tab in your browser it should look a little something like this.

3. Drag and Drop the folder that your files are in into Netlify.

4. Click on “Site Settings” (the link is shown below)

5. Under site details change the site name to be “<your-nait-username>-cpssc1520-inclass5” like so.

Grading

I'll give full marks if:

- The name of **your Netlify app is renamed to your name.**
- I can filter the video games based on platform when I click submit.
- When I click a video game item in the “classics” list it adds to the “my favourites” list
- When I click a video game item in the “my favourites” list it removes the item from that list.

If you don't follow the instructions you'll get a zero. There are no marks in between.
